## Lifecycle Investment Strategy Parameters

---

### Age Parameters:

- Career Start: 25
- Retirement Age: 65
- Planning Horizon: 85

### Income Parameters:

- Initial Earnings: \$100k
- Earnings Growth: 2.0%
- Peak Earnings Age: 50

### Subsistence Expense Parameters:

- Base Expenses: \$60k
- Retirement Expenses: \$80k

### Consumption Model:

- Total Consumption = Subsistence + Rate x Net Worth
- Net Worth = Human Capital + Financial Wealth - PV(Future Expenses)
- Consumption Rate = Median Return + 1pp

### Human Capital Allocation:

- Stock Beta: 0.10
- Bond Duration Benchmark: 20.0 years

### Mean-Variance Optimization (DGP Parameters):

- Risk-Free Rate ( $r_{\bar{r}}$ ): 2.0%
- Equity Premium ( $\mu$ ): 4.0%
- Stock Volatility ( $\sigma$ ): 18%
- Risk Aversion ( $\gamma$ ): 2.0
- Allocation Source: Mean-Variance Optimization
- $w^* = \mu / (\gamma * \sigma^2) = 0.04 / (2.0 * 0.18^2) = 61.7\%$

### Target Total Wealth Allocation (from MV):

- Stocks: 61.7%
- Bonds: 28.7%
- Cash: 9.6%

### Key Insights:

---

1. Portfolio allocation is derived from mean-variance optimization using consistent DGP parameters.
2. The Merton optimal share  $w^* = \mu / (\gamma * \sigma^2)$  determines target stock allocation in total wealth.
3. Changing  $\gamma$ ,  $\mu$ , or  $\sigma$  allows studying how retirement trajectories respond to return assumptions.
4. Human capital is treated as implicit asset holdings, and financial portfolio adjusts to reach total targets.
